Definitions and Conditions

Specifications represent warranted performance of a calibrated instrument that has been stored for a minimum of 2 hours within the operating temperature range of 0 to 55 °C, unless otherwise stated, and after a 45 minute warm-up period. The specifications include measurement uncertainty. Data represented in this document are specifications unless otherwise noted.

Typical (typ) describes additional product performance information that is not covered by the product warranty. It is performance beyond specifications that 80 percent of the units exhibit with a 90 percent confidence level at room temperature (approximately 25 °C). Typical performance does not include measurement uncertainty.

Nominal (nom) values indicate the expect mean or average performance, or an attribute whose performance is by design, such as the 50 ohm connector. This data is not warranted and is measured at room temperature (approximately 25 °C).

Measured (meas) describes an attribute measured during the design phase for purposes of communicating expected performance, such as amplitude drift vs. time. This data is not warranted and is measured at room temperature (approximately 25 °C).

1. N is a factor used to help define certain specifications within the document.
2. Time from receipt of SCPI command or trigger signal to within 0.1 ppm of final frequency or within 100 Hz, whichever is greater, and amplitude settled to within 0.2 dB from 20 to 30 °C. When switching into or out of band 6 amplitude settling time is within 0.3 dB. Implies simultaneous frequency and amplitude switching.
3. With internal channel corrections on, the frequency switching speed is < 1.3 ms, measured for list mode and SCPI mode cached frequency points. For the initial frequency point in SCPI mode the time is < 3.3 ms, measured. The instrument will automatically cache the most recently used 1024 frequencies. There is no speed degradation for amplitude-only changes.
4. Specifications apply when status register updates are off. For export control purposes CW switching speed to within 0.05% of final frequency is 190 µs (measured).

Simultaneous and composite modulation [2]						
Simultaneous modulation	All modulation types (I/Q, FM, AM, ΦM, and pulse modulation) may be simultaneously enabled except: FM and phase modulation cannot be combined and two modulation types cannot be simultaneously generated using the same modulation source; for example, the baseband I/Q generator, AM, and FM can run concurrently and all will modulate the output RF (this is useful for simulating signal impairments)					
Composite modulation	AM, FM, and ΦM each consist of two modulation paths which are summed internally for composite modulation; modulation can be any combination of internal or external sources

Trigger in	Accepts TTL and CMOS level signals for triggering point-to-point in sweep mode; damage levels are ≤ –0.3 V and ≥ +5.3 V
Trigger out	Outputs a TTL and CMOS compatible level signal for use with sweep mode The signal is high at start of dwell, or when waiting for point trigger in manual sweep mode, and low when dwell is over or point trigger is received This output can also be programmed to indicate when the source is settled, pulse synchronization, or pulse video Nominal output impedance 50 Ω Input damage levels are ≤ –0.3 V and ≥ +5.3 V
Reference input	Accepts a 10 MHz reference signal used to frequency lock the internal timebase; Option 1ER adds the capability to lock to a frequency from 1 MHz to 50 MHz; nominal input level –3 to +20 dBm, impedance 50 Ω, sine or square waveform
10 MHz out	Outputs the 10 MHz reference signal used by internal timebase; level nominally +3.9 dBm; nominal output impedance 50 Ω; input damage level is +16 dBm
LO in (Option 012)	Accepts a signal from a master signal generator that is used as the LO for EXG vector in order to configure a phase coherent system; nominal input levels between 0 to +12 dBm; nominal input impedance 50 Ω
LO out (Option 012)	Outputs a reference signal that can be used in a phase coherent system; nominal output levels between 0 to +12 dBm; nominal output impedance 50 Ω
DAC Clk In (Option 012)	Reserved for future use.
Digital bus I/O	To be used with PXB or N5102A digital signal interface module

Aux I/O	Aux I/O port sends and/or receives auxiliary signaling information: For Option UN7 this connector is used to output reference data, clock, error signals, and more Output markers to an external device from arbitrary waveform or real-time generation application such as: frame markers, pulse-per-second, even-second, and more. Input signals from external DUT to modify characteristics of a signal being generated. Such as: changing output power (power control loop testing), advancing or delaying timing (timing advance loop testing), HARQ ACK/NAK delivery (HARQ process loop testing) or streaming external data, clock and symbol synch for custom modulation. I/O is application specific (CDMA, 3GPP, GNSS, LTE, custom etc). See User Guide or Signal Studio help for more details. Connector type: 36 pin 3M connector (part number N10236-52B2PC). The mating connector is a 3M 10136-3000 wire mount plug or 3M 10136-8000 IDC plug with a 3M 10336 shell. For Option 431 real-time custom modulation the follow pin numbers are assigned: Data input = pin 23 Data clock input = pin 29 Symbol sync input = pin 25 Burst input = pin 27 Data output = pin 35 Data clock output = pin 6 Symbol sync output = pin 37 Event 1 output = pin 1 Event 2 output = pin 33
USB 2.0	The USB connector provides remote programming functions via SCPI
